## EXERCISES (62.5\%)

I - XYZ is a cosmetics company that produces perfume. The perfume market is very competitive and subject to frequent changes.

The finance team at XYZ prepare monthly budgets as part of their planning and management control process.

## July Exams 2015

The data for the forthcoming new budget period are as follows:

The variable cost of producing a bottle of perfume is $\$ 21$.
The planned selling price of a bottle of perfume is $\$ 45$ and at this selling price the demand for perfume is expected to be 125,000 bottles. Information from the marketing division at XYZ suggests that for every $\$ 3$ increase in the selling price the customer demand would reduce by 10,000 bottles, and that for every $\$ 3$ decrease in the selling price the customer demand would increase by 10,000 bottles.

Note: If $\mathrm{P}=\mathrm{a}-\mathrm{bx}$ then $\mathrm{MR}=\mathrm{a}-2 \mathrm{bx}$
Equations to use for calculations are:

$$
\begin{aligned}
& P=a-b x \\
& M R=a-2 b x \\
& \text { Where: } \\
& P=\text { Optimum price } \\
& a=\text { current price } \\
& b=\text { change in price per unit } \\
& x=\text { number of units } \\
& M R=\text { marginal revenue }
\end{aligned}
$$

## Required:

Calculate the revenue that XYZ would earn if the selling price of a bottle of perfume was set so that profits would be maximised for the forthcoming budget period. (8\%)

Revenue = \$5,304,375
To calculate the marginal revenue function the demand function must first be established.
$P=a-b x$
$b=3 / 10,000=0.0003$
$45=\mathrm{a}-0.0003^{*} 125,000$. Therefore, $\mathrm{a}=82.50$
$\mathrm{P}=82.50-0.0003 \mathrm{x}$
$M R=a-2 b x, M R=82.50-2 * 0.0003 x$
Profit is maximised when MR = MC
MC = \$21
$21=82.50-2^{*} 0.0003 x$. Therefore $x=102,500$
Substitute the value of $x$ into the demand function to get price
82.50-0.0003*102,500 = \$51.75

Revenue = \$51.75 * 102,500 = \$5,304,375

1. Compute the return on total assets.
2. Compute the return on common stockholders' equity.
3. Compute the current ratio.
4. Compute the acid-test ratio.
5. Compute the inventory turnover.
6. Compute the average sale period.
7. Compute the debt-to-equity ratio.

## Answers:

1. Return on total assets:

| Return on total assets $=$ | $\frac{\text { Net income }+[\text { Interest expenses } \times(1-\text { Tax rate })]}{\text { Average total assets }}$ |
| ---: | :--- |
|  | $=\frac{\$ 672+[\$ 0 \times(1-0.36)]}{(\$ 5,344+\$ 4,429) / 2}=13.8 \%$ (rounded) |

2. Return on common stockholders' equity:

## Net income - Preferred dividends

Return on a common stockholders' equity =
Average common stockholders' equity

$$
=-\frac{\$ 672-\$ 0}{}=29.8 \%
$$

(rounded)

$$
(\$ 2,284+\$ 2,228) / 2
$$

3. Current ratio:

Current assets
Current ratio $=$ $\qquad$
Current liabilities
\$1,696
$=\frac{}{\$ 2,156}=0.79$ (rounded)
4. Acid-test ratio:

Cash + Marketable securities + Accounts receivable + Short-term
notes receivable
Acid-test ratio $=$

$$
=\frac{\$ 281+\$ 157+\$ 288+\$ 0}{\$ 2,156}=0.34(\text { rounded })
$$

5. Inventory turnover:
Inventory turnover $=\frac{\text { Cost of goods sold }}{\text { Average inventory balance }}$

$$
=\frac{\$ 3,999}{(\$ 692+\$ 636) / 2}=6.02(\text { rounded })
$$

6. Average sale period:

$$
\begin{aligned}
\text { Average sale period } & =\frac{365 \text { days }}{\text { Inventory turnover }} \\
& =\frac{365 \text { days }}{6.02}=61 \text { days (rounded) }

7. Debt-to-equity ratio:

$$
\begin{aligned}
\text { Debt-to-equity ratio } & =\frac{\text { Total liabilities }}{\text { Stockholders' equity }} \\

IV - The ROBOT SAL makes a product called Z. Some of the manufacturing expenses are easily identified as fixed or variable directly with production. The cost accountant of the company is confronted with the problem of preparing a flexible budget for the coming year and wishes to determine the fixed and variable elements of the mixed factory overhead. The following details are provided for the first 10 months of the past year:

| Month | Number of Units <br> Produced $x$ | Mixed Factory <br> Overhead $y$ |
| :---: | :---: | :---: |
| 1 | 1,500 | $\$ 800$ |
| 2 | 2,000 | 1,000 |
| 3 | 3,000 | 1,350 |
| 4 | 2,500 | 1,250 |
| 5 | 3,000 | 1,300 |
| 6 | 2,500 | 1,200 |

July Exams 2015

| 7 | 3,500 | 1,400 |
| :--- | ---: | ---: |
| 8 | 3,000 | 1,250 |
| 9 | 2,500 | 1,150 |
| 10 | $\underline{1,500}$ | $\underline{800}$ |
|  | $\underline{\underline{25,000}}$ | $\underline{\underline{\$ 11,500}}$ |

## Required:

Determine the fixed and variable elements of the mixed factory overhead using the high-low method.

## Answer:

|  | $x$ | $\frac{y}{\$ 1,400}$ |
| :--- | :--- | :--- |
| High | 3,500 units | $\underline{800}$ |
| Low | $\underline{1,500}$ | $\underline{\underline{\$ 100}}$ |
| Difference | $\underline{\underline{2,000}}$ units |  |

Variable rate: $\$ 600 / 2,000$ units $=\$ 0.30 /$ unit.

Fixed element:

|  | $\underline{\text { High }}$ |  |  |  |  | $\underline{\text { Low }}$ |
| :--- | :--- | :--- | :--- | :---: | :---: | :---: |
| Mixed overhead | $\underline{\$ 1,400}$ | $\$ 800$ |  |  |  |  |
| Variable (\$0.30/unit) | $\underline{1,050}$ | $\underline{450}$ |  |  |  |  |
|  | $\underline{\$ 350}$ | $\underline{\underline{\$ 350}}$ |  |  |  |  |

Therefore the formula is:
$\$ 350$ fixed + \$0.30 per unit

V - The Smart Co. SAL reports the following balance sheet data:

| Current liabilities | $\$ 280,000$ |
| :--- | ---: |
| Bonds payable, $16 \%$ | 120,000 |
| Preferred Stock, 14\%, \$100 par value | 200,000 |
| Common Stock, \$25 par value, 16,800 shares | 420,000 |
| Premium on common stock | 240,000 |
| Retained Earnings | 180,000 |

Income before taxes is $\$ 160,000$. The tax rate is $40 \%$. Common stockholders' equity in the previous year was $\$ 800,000$. The market price per share of common stock is $\$ 35$. Calculate:
a) Net income
b) Preferred dividends
c) Return on common stock
d) Earnings per share
e) Price-earnings ratio
f) Book value per share

July Exams 2015

Solution
(a)
Income before taxes
Taxes (40\% rate)
\$160,000 64,000
Net income
\$ 96,000
(b) $14 \% \times \$ 200,000=\$ 28,000$
(c) Common stockholders' equity:

| Common stock | $\$ 420,000$ |
| :--- | ---: |
| Premium on common stock | 240,000 |
| Retained earnings | $\underline{180,000}$ |
| Common stockholders' equity | $\underline{\$ 840,000}$ |

Return on common stock $=\underline{\text { Net income }- \text { preferred dividends }}$
Average common stockholders' equity
$=\frac{\$ 96,000-\$ 28,000}{(\$ 800,000+\$ 840,000) / 2}=\begin{aligned} \$ 68,000 \\ \$ 820,000\end{aligned}=0,08$
(d) Earnings per share $=$ Net income - preferred dividends

Common stock outstanding
$=\$ 96,000-\$ 28,000=\$ 4,05$
16,800 shares
(e) Price - earnings ratio = Market price per share $=\mathbf{\$ 3 5 , 0 0}=864$ times

Earnings per share \$4,05
(f) Book value per share = stockholders' equity - preferred stock

Common stock outstanding
$=\$ 840,000=\$ 50$ per share
$\$ 16,800$ shares
